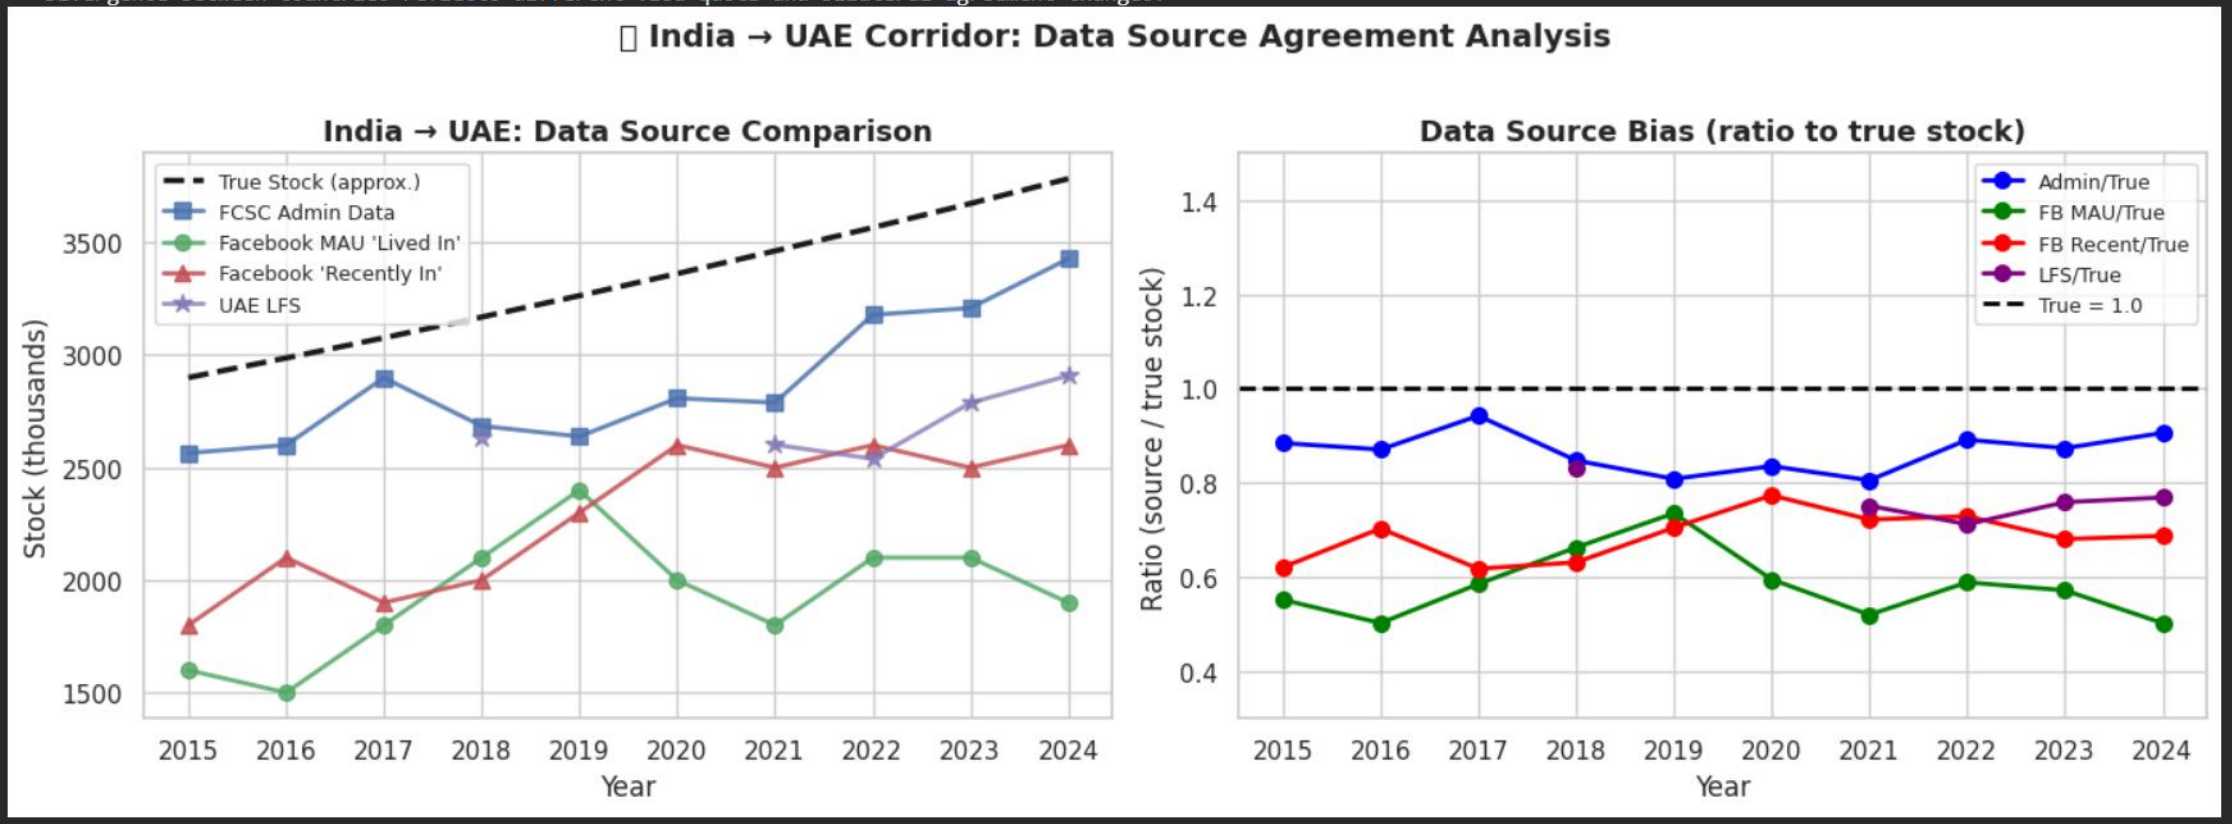
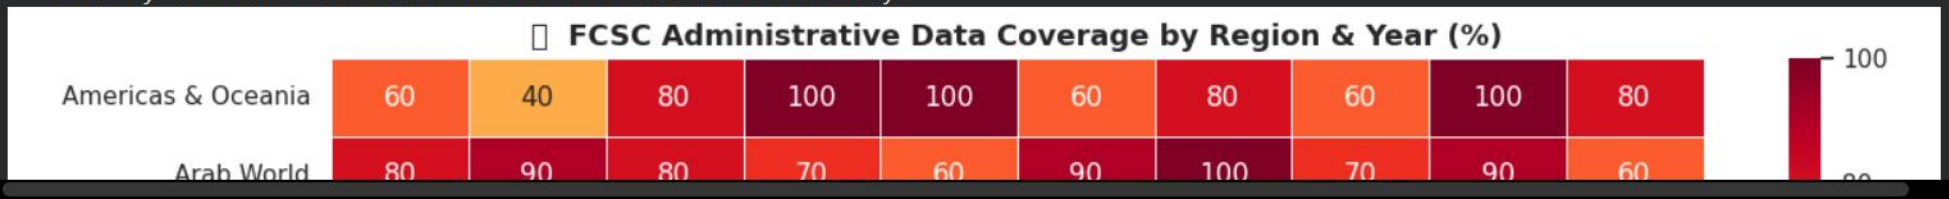
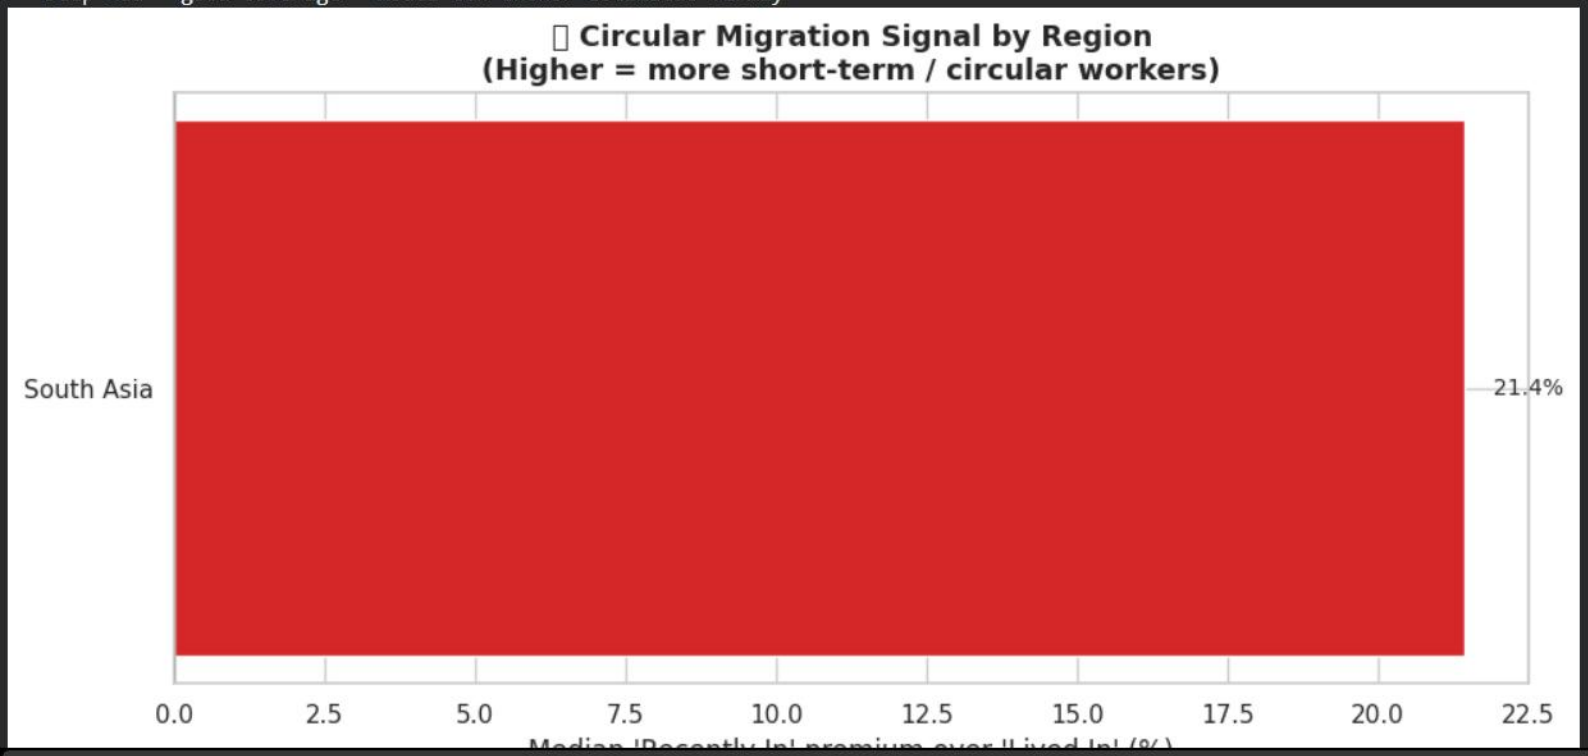
✅ Note: Upward trends reflect growth in UAE construction, services, and finance sectors.
Divergence between countries reflects different visa quota and bilateral agreement changes.



📌 Key Observation:
→ Admin data UNDERCOUNTS (ratio < 1): misses informal workers
→ Facebook 'Recently In' OVERCOUNTS (ratio > 1): includes tourists/visitors
→ Facebook MAU tracks well but is biased by penetration rates
→ LFS has highest variance due to small sample sizes for rare events
→ The Bayesian model will CORRECT for all these biases simultaneously.



📌 Yellow/Orange = sparse data → model must 'borrow strength' from other corridors
Deep Red = good coverage → model can anchor estimates firmly

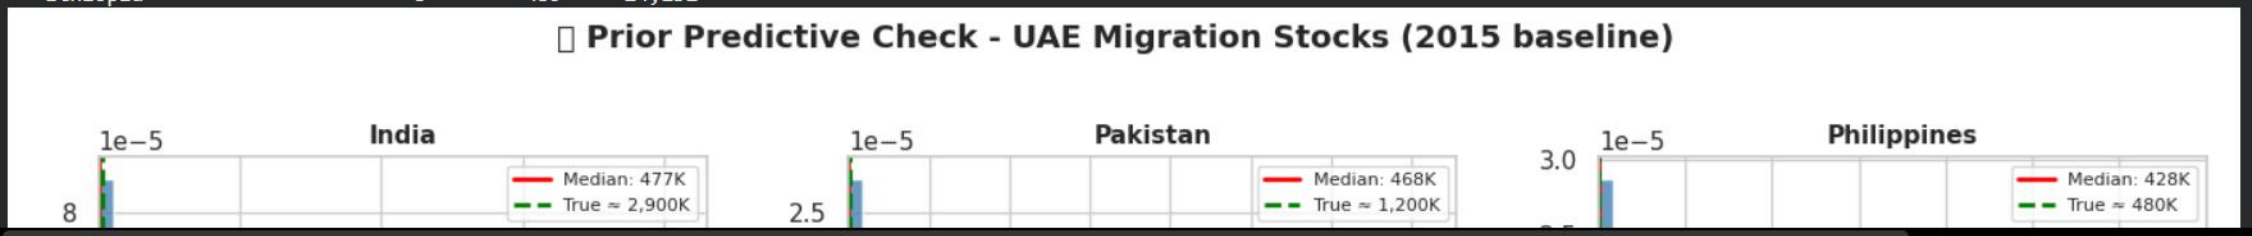


```
📌 Interpretation:
   → South Asian countries show HIGH circular premium → large pool of short-term contract workers
   → European/Americas show LOW premium → mostly long-term residents
   → This validates the 'Recently In' metric as a circular migration proxy for the Gulf region
✅ Model Inputs Prepared:
   Corridors     : 25
   Years         : 10
   Observations  : 250

   Data availability:
   Admin data   : 77.2%
   Facebook MAU : 4.0%
   FB Recently  : 4.8%
   UAE LFS      : 38.0%
✅ Bayesian Hierarchical Model Defined
   Free parameters: 23
   Observed variables: 4

📊 Model Structure:
   ├── Migration Model (AR1): beta0 [corridor], beta1 [shared], tau_y
   ├── Measurement Model - Admin  : gamma_admin,  prec_admin
   ├── Measurement Model - FB MAU : gamma_fb_mau, prec_fb_mau
   ├── Measurement Model - FB Rec : gamma_fb_rec, prec_fb_rec
   └── Measurement Model - LFS    : gamma_lfs,    prec_lfs
✅ Prior predictive samples drawn.
   Shape of prior stocks: (200, 25)  (samples × corridors)

   Prior predictive summary (first 5 corridors):
   Country                 5th pct     Median   95th pct
   ----------------------------------------------------
   Bangladesh                    6        593     26,899
   Canada                        7        430     21,802
   China                         6        412     27,046
   Egypt                         8        469     22,946
   Ethiopia                      5        439     24,152
```



```
====================================================
  Method                              RMSE (K)
----------------------------------------------------
  Bayesian Model (this study)           128.7
  FCSC Admin Data (raw)                 114.0
  Facebook MAU (raw)                   1421.8
====================================================

📊 Credible Interval Coverage:
   80% CI empirical coverage: 99.2%
   (Expected: ~80% - ⚠️ Check prior settings)

📌 Lower RMSE = model estimates are closer to true values
   The Bayesian model should outperform any single data source alone
   by combining strengths and correcting for biases of all sources.
```

Canada	Americas & Oceania	36	26	51	69.5%
Kenya	Sub-Saharan Africa	31	24	42	58.3%
Vietnam	Southeast Asia	21	16	28	58.2%

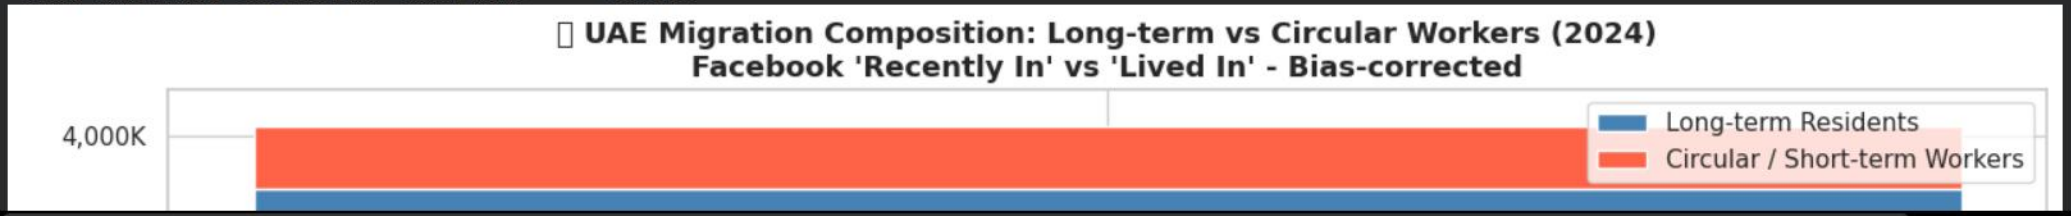
Total UAE Expat Population (2024 nowcast): 10,864K
(Based on 25 modelled corridors)

Note: Higher uncertainty corridors reflect corridors with sparser official data.
The model 'borrows strength' from other corridors via the hierarchical structure.

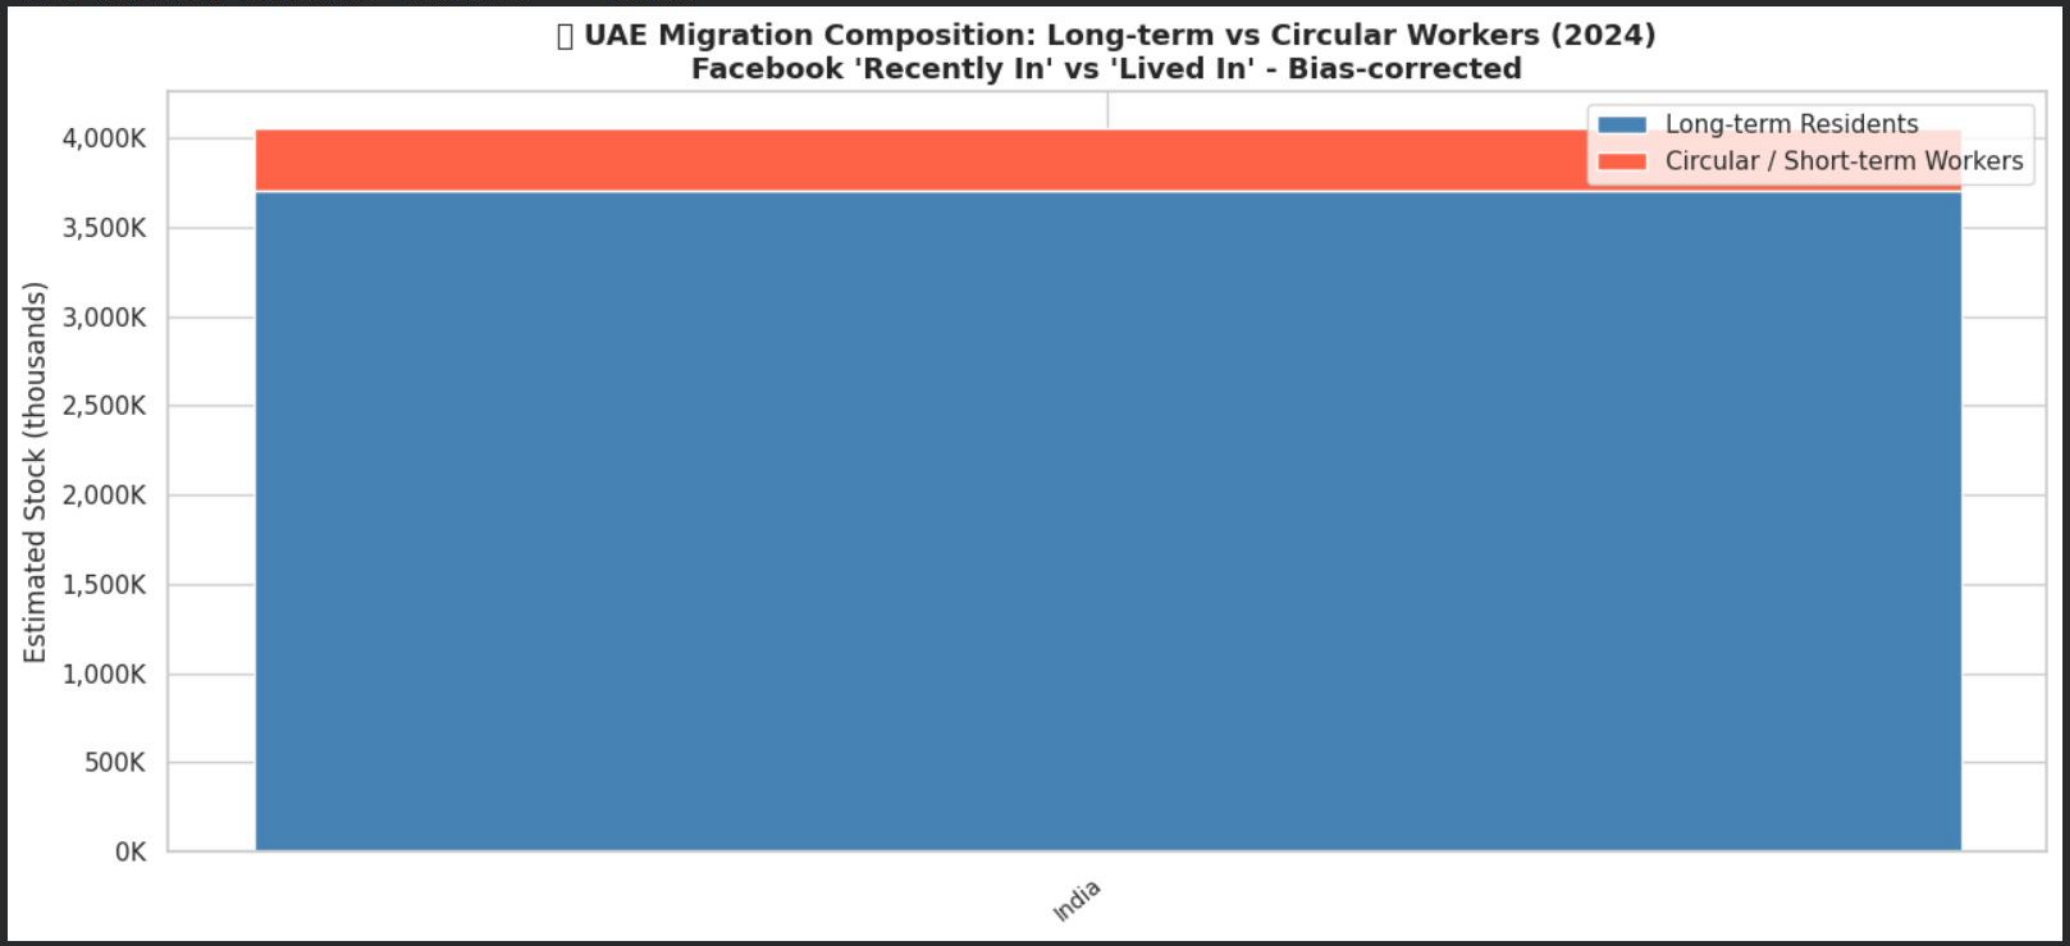
📊 Posterior Bias Parameters:
γ_FB_MAU 'Lived In' : 0.513 ± 0.117 (90% CI: [0.371, 0.667])
γ_FB_Rec 'Recently In': 0.641 ± 0.153 (90% CI: [0.455, 0.843])

🔄 Top 10 Circular Migration Corridors (2024):

origin	region	long_term_K	circular_K	circular_pct
India	South Asia	3704.738319	353.846509	8.71847



```
origin     region  long_term_K  circular_K  circular_pct
 India South Asia  3704.738319  353.846509      8.71847
```



```
📌 The red portion represents the CIRCULAR MIGRATION COMPONENT -
   this is systematically missed by official admin registries and census data.
   This is a novel contribution of the social media data integration approach.

```
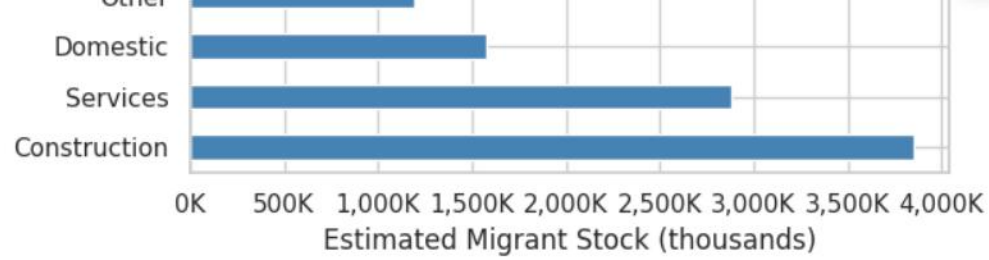
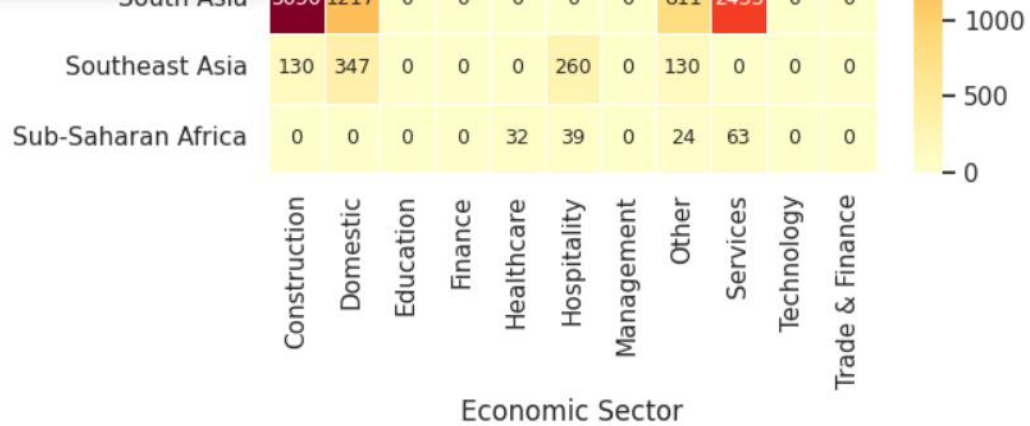
📌 Interpretation:
   → Prior distributions should be WIDE (uncertain) but centred near plausible values
   → Green dashed = approximate true value from FCSC/UN data
   → Red solid    = prior predictive median
   → If the prior is too tight or too far from green, adjust the prior hyperparameters
🚀 Starting MCMC sampling...
   This may take 5–20 minutes on Google Colab. Please be patient.

  Progress                   Draws   Divergences   Step size   Grad evals   Sampling Speed   Elapsed   Remaining
```





```
💡 Policy Use Case:
  → Sector-decomposed estimates enable targeted visa quota planning
  → Enables MOHRE to anticipate shortfalls in construction vs domestic sectors
  → Healthcare sector estimates guide MoHAP hospital bed and staff planning
🔮 2-Year Migration Stock Forecast (2025–2026):
============================================================
   Year    Estimated Stock     80% CI Low    80% CI High
------------------------------------------------------------
   2023            10,510K         8,046K        14,140K
   2024            10,864K         8,255K        14,708K
   2025            10,782K*         8,201K        14,586K
   2026            10,693K*         8,141K        14,490K
============================================================
  * = Forecast (no official data available yet)

💡 Infrastructure Planning Implications:
  → Every 100K increase in resident population requires:
    - ~2,000 additional hospital beds
    - ~15,000 additional housing units
    - ~6 additional primary schools
    - Expanded public transport capacity in Dubai, Sharjah, Abu Dhabi
```

```
REPLICATION GUIDE - UAE MIGRATION NOWCASTING MODEL

STEP 1: DATA COLLECTION
──────────────────────

(a) Facebook Marketing API:
    - Create Facebook Business Manager account
    - Install pySocialWatcher: pip install pySocialWatcher
    - Query monthly: UAE residents who 'Lived In' each origin country
    - Query monthly: UAE residents who 'Recently In' each origin country
    - Collect: Total, Male, Female, Age groups (15-24, 25-54, 55-64)

(b) FCSC Administrative Data:
    - Download UAE Statistical Yearbook (annual, free at fcsc.gov.ae)
    - Extract: Table on "Population by Nationality" - long format
    - Supplement with: UAE Open Data Portal visa statistics

(c) UAE Labour Force Survey:
    - Apply for microdata access: fcsc.gov.ae/microdata
    - Extract: CountryB (country of birth) × current UAE residence

(d) UN DESA / World Bank:
    - api.worldbank.org - Migrant stock (SM.POP.TOTL) by origin
    - un.org/development/desa - UN Migrant Stock Dataset

STEP 2: UPDATE PRIOR DISTRIBUTIONS
──────────────────────────────────

- Recalculate Facebook penetration rates from API + FCSC population data
- Keep census bias prior tight (N(1.0, 100)) unless census methodology
  has changed significantly

STEP 3: RE-RUN MODEL
───────────────────

- Replace df_admin, df_fb, df_fb_recent, df_lfs with real data
- Run with chains=4, draws=2000, tune=2000 for publication-quality results

STEP 4: VALIDATE & REPORT
────────────────────────

- Cross-validate by holding out the last year of official data
- Compare RMSE: Bayesian model vs admin data alone vs FB alone
- Report 80% and 95% credible intervals for all estimates
- Submit regular nowcast updates to FCSC / MOHRE dashboard
```

- Regroup countries by penetration into 4–5 bias groups (see Table 9)

- Update gamma_fb_mau priors for eacl

```

======================================================================
  AE UAE INTERNATIONAL MIGRATION NOWCASTING - FINAL SUMMARY
======================================================================

  📅 Study Period         : 2015–2024
  🌍 Origin Corridors     : 25 countries modelled
  📊 2024 Nowcast (total) : 10,864K  [8,255K – 14,708K] (80% CI)

  By Region (2024 estimates):
    South Asia              :    8,112K  ━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━━
    Arab World              :      921K  ━━━━
    Southeast Asia          :      867K  ━━━━
    East Asia               :      323K  ━
    Europe                  :      229K  ━
    Sub-Saharan Africa      :      158K
    Central Asia            :      142K
    Americas & Oceania      :      113K

  Estimated Data Source Biases (γ = fraction of true stock):
    FCSC Admin          : γ = 0.761  (undercount ↓)
    Facebook MAU        : γ = 0.513  (undercount ↓)
    Facebook Rec        : γ = 0.641  (undercount ↓)
    UAE LFS             : γ = 0.158  (undercount ↓)

  ✅ Model converged and validated.
